## DNA MOLECULES ENCODING BACTERIAL LYSINE 2,3-AMINOMUTASE

## ABSTRACT OF THE DISCLOSURE

Purified β-amino acids are of considerable interest in the preparation of pharmacologically active compounds. Although enantiomerically pure β-amino acids, such as L-β-lysine, can be produced by standard chemical synthesis, this traditional approach is time consuming, requires expensive starting materials, and results in a racemic mixture which must be purified further. However, DNA molecules encoding lysine 2,3-aminomutase can be used to prepare L-β-lysine by methods that avoid the pitfalls of chemical synthesis. In particular, L-β-lysine can be synthesized by cultures of host cells that express recombinant lysine 2,3-aminomutase. Alternatively, such recombinant host cells can provide a source for isolating quantities of lysine 2,3-aminomutase, which in turn, can be used to produce L-β-lysine *in vitro*.
